

23 RECORD PCT/PTO 25 SEP 1998

U.S. DEPARTMENT OF COMMERCE, PATENT AND TRADEMARK OFFICE		DATE: September 25, 1998
TRANSMITTAL LETTER TO THE UNITED STATES DESIGNATED/ELECTED OFFICE (DO/EO/US) CONCERNING A FILING UNDER 35 U.S.C. 371		U.S. APPLN. NO. (if known): <b>09/147052</b>
INTERNATIONAL APPLICATION NO.: PCT/JP97/01084	INTERNATIONAL FILING DATE: March 28, 1997	PRIORITY DATE CLAIMED: March 29, 1996
TITLE OF INVENTION: NOVEL FUSION PROTEIN, GENE THEREOF, RECOMBINANT VECTOR BEARING THE GENE AND RECOMBINANT VIRUS AS WELL AS USE THEREOF		
APPLICANT(S) FOR DO/EO/US: Shuji SAITO, Yoshinari TSUZAKI and Noboru YANAGIDA		
Applicant hereby submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information:		
1. <input checked="" type="checkbox"/> This is a FIRST submission of items concerning a filing under 35 U.S.C. 371.		
2. <input type="checkbox"/> This is a SECOND or SUBSEQUENT submission of items concerning a filing under 35 U.S.C. 371.		
3. <input checked="" type="checkbox"/> This express request to begin national examination procedures (35 USC 371(f)) at any time rather than delay examination until the expiration of the time limit set in 35 USC 371(b) and PCT Articles 22 and 39(1).		
4. <input checked="" type="checkbox"/> A proper Demand for International Preliminary Examination was made by the 19th month from the earliest claimed priority date.		
5. <input checked="" type="checkbox"/> A copy of the International Application as filed (35 U.S.C. 371(c)(2)): <ul style="list-style-type: none"><li>a. <input type="checkbox"/> is transmitted herewith (required only if not transmitted by the International Bureau).</li><li>b. <input checked="" type="checkbox"/> has been transmitted by the International Bureau.</li><li>c. <input type="checkbox"/> is not required, as the application was filed in the United States Receiving Office (RO/US)</li></ul>		
6. <input checked="" type="checkbox"/> A translation of the International Application into English (35 U.S.C. 371(c)(2)).		
7. <input checked="" type="checkbox"/> Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371(c)(3)) <ul style="list-style-type: none"><li>a. <input type="checkbox"/> are transmitted herewith (required only if not transmitted by the International Bureau).</li><li>b. <input type="checkbox"/> have been transmitted by the International Bureau.</li><li>c. <input type="checkbox"/> have not been made; however, the time limit for making such amendments has NOT expired.</li><li>d. <input checked="" type="checkbox"/> have not been made and will not be made.</li></ul>		
8. <input type="checkbox"/> A translation of the amendments to the claims under PCT Article 19 (35 U.S.C. 371(c)(3)).		
9. <input type="checkbox"/> An oath or declaration of the inventor(s) (35 U.S.C. 371(c)(4)).		
10. <input type="checkbox"/> A translation of the International Preliminary Examination Report under PCT Article 36 (35 U.S.C. 371(c)(5)).		
ITEMS 11. TO 16. BELOW CONCERN OTHER DOCUMENT(S) OR INFORMATION INCLUDED:		
11. <input checked="" type="checkbox"/> An Information Disclosure Statement under 37 CFR 1.97 and 1.98 together with the International Search Report and 7 references.		
12. <input type="checkbox"/> An assignment document for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included.		
13. <input type="checkbox"/> A FIRST preliminary amendment. <input type="checkbox"/> A SECOND or SUBSEQUENT preliminary amendment		
14. <input type="checkbox"/> A substitute specification.		
15. <input type="checkbox"/> A change of power of attorney and/or address letter.		
16. <input checked="" type="checkbox"/> Other items or information: 8 sheets of drawings; translation of IPE report.

## DESCRIPTION

NOVEL FUSION PROTEIN, GENE THEREOF,  
RECOMBINANT VECTOR BEARING THE GENE  
AND RECOMBINANT VIRUS AS WELL AS USE THEREOF

## TECHNICAL FIELD

The present invention relates to a novel fusion polypeptide of a polypeptide having the antigenicity of Mycoplasma gallisepticum and a polypeptide derived from 5 the outer membrane protein of herpes viruses, a hybrid DNA coding for the fusion polypeptide, and a recombinant Avipox virus bearing the hybrid DNA, as well as a vaccine using the recombinant Avipox virus.

## BACKGROUND ART

10 Mycoplasma gallisepticum (hereinafter sometimes abbreviated as MG) is a bacterium that causes reduction in an egg-laying rate and a hatching rate of eggs for poultry including chicken. This causative MG is widely spread all over the world so that a great deal of damage 15 has been done to the poultry farming. For the prevention of MG, an inactivated vaccine or a live vaccine is currently utilized. However, the former live vaccine involves disadvantages of complicated inoculation procedures, short duration of immunity, expensive etc. 20 The latter vaccine has such a defect that an unexpected

disease might be developed by use in combination with live vaccine for other disease. Another disadvantage is that MG agglutination reaction system, which makes rapid detection of MG infection possible, can not be used for 5 both inactivated and live vaccines.

It is expected that a protein derived from MG such as its antigenic protein for preventing from MG infection would be produced by genetic engineering technology and utilized as a vaccine.

10 The production system of the antigenic protein of Mycoplasma gallisepticum using E. coli or yeast by means of genetic engineering (JPA 2-111795, etc.) encounters such problems that depending upon a protein to be expressed, the antigenic protein is only expressed in 15 a less amount, proteins of host origin might be by-produced and intermingled, host-derived pyrogen is removed only with difficulty, etc. For these reasons, studies are still focused on a recombinant virus to prepare antigenic proteins or on a recombinant live 20 vaccine.

The expression of foreign genes using recombinant viruses, in most cases, genes of eucaryotes or viral genes are expressed. For this reason, addition or expression mode of sugar chains or the like is similar 25 to the protein expression mechanism in infected cells. Thus, induction of an antibody titer to the expressed protein was relatively easy in vivo. However, genes of prokaryotes are rarely expressed in recombinant viruses.

Because of different expression mode between eukaryotes and prokaryotes, it was difficult to say that a specific antibody was effectively induced (Austen et al., Protein Targeting and Selection, Oxford Univ. Press (1991)).

5           Turning to MG, recombinant viruses in which a gene coding for the protein has been incorporated are known by JPA 5-824646 and JPA 7-133295, WO 94/23019, etc. In particular, WO 94/23019 reveals that when a recombinant virus capable of expressing the antigenic 10 protein of MG having a viral membrane anchoring region, which is obtained by ligating the signal membrane anchoring portion of HN gene of New Castle disease virus (hereinafter abbreviated as NDV) with the antigenic gene of MG, is inoculated as a recombinant live vaccine, the 15 antibody is induced more effectively than a recombinant virus capable of expressing the antigenic gene of MG alone.

However, expression to such an extent is not always sufficient to achieve the desired effect as a 20 vaccine.

Therefore, it is the urgent need to find an improved method for higher recognition of the antigen in order to develop an effective vaccine against MG infections.

25           Outer membrane proteins other than NDV mentioned above are known also in the genus Herpesvirus, etc. With respect to glycoproteins B(gB), C(gC), D(gD), H(gH) and I(gI) of herpes simplex viruses; proteins gBh,

gCh, gDh, gHh and gIh of Marek's disease viruses (hereinafter often referred to as MDV) corresponding to herpes simplex virus glycoproteins gB, gC, gD, gH and gI and proteins of the genus Herpesvirus homologous to those 5 proteins described above, etc., the nucleotide sequence and amino acid sequence of these proteins are known. It is also known that a part of these proteins induces neutralizing antibodies of herpes simplex viruses (Deluca et al., *Virology*, 122, 411-423 (1982)). It is further 10 known that neutralizing antibodies can be induced by incorporating genes coding for these proteins into vaccinia viruses and expressing the genes (Blacklaws et al., *Virology*, 177, 727-736 (1990)).

However, investigations to make use of signal 15 sequences of such outer membrane proteins of the genus Herpesvirus were hardly made so far.

#### DISCLOSURE OF THE INVENTION

Under the situation of the prior art stated above, the present inventors have made extensive studies 20 to provide a recombinant virus capable of expressing a Mycoplasma antigenic protein having an enhanced infection prevention activity in large quantities, which allows a host to recognize the antigen highly efficiently. As a result, it has been found that by infecting to a host a 25 recombinant Avipox virus, in which a hybrid DNA obtained by ligating a DNA of the outer membrane protein of the genus Herpesvirus with a DNA of the antigenic protein of

Mycoplasma has been inserted, the antigen recognizing ability of the host can be markedly improved. The present invention has thus been accomplished.

Accordingly, the present invention provides:

5           a fusion protein comprising a polypeptide having the antigenicity of Mycoplasma gallisepticum (hereinafter sometimes referred to as Mycoplasma-derived polypeptide) and a polypeptide derived from the outer membrane protein of a herpes virus (hereinafter sometimes 10 referred to as Herpesvirus-derived polypeptide) characterized in that the polypeptide derived from outer membrane protein is ligated with the polypeptide having the antigenicity of Mycoplasma gallisepticum at the N terminus thereof;

15           a hybrid DNA coding for the fusion protein;

              a recombinant Avipox virus in which the hybrid DNA has been incorporated; and,

              a live vaccine comprising the recombinant Avipox virus as an effective ingredient.

#### 10 BEST MODE FOR PRACTICING THE INVENTION

##### Mycoplasma-derived polypeptides and genes therefor

In the present invention, the term Mycoplasma-derived polypeptides is used to mean the antigenic proteins that cause an antigen-antibody reaction with MG 15 immune serum or MG infected serum and that are derived from MG. These polypeptides are not restricted to proteins per se that native Mycoplasma gallisepticum expresses, and may include modified polypeptides. For example, one or more amino acids of the polypeptides may 20 be modified naturally or artificially in a conventional manner such as site-specific mutation, etc. (JPB 6-16709, etc.) through loss, addition, insertion, deletion, substitution, etc. Of course, the proteins, even after such modification, should contain the epitope showing the 25 antigenicity. For determination of the epitope region, there are available known methods based on the peptide scanning technique such as the method of Geysen et al.

(J. Immunol. Meth., 102, 259-274 (1987)), the method of Hopp et al., (Proc. Natl. Acad. USA, 78, 3824-3828 (1981)), the method Chou et al. (Advances in Enzymology, 47, 145-148 (1987)), etc.

5                 Specific examples of the peptides having the antigenicity include antigenic proteins disclosed in JPA 2-111795 (U.S. Patent Application Serial Nos. 359,779, 07/888,320 and 08/299,662), JPA 5-824646 (U.S. Patent No. 5,489,430), WO 94/23019 (U.S. Patent Application Serial 10 No. 08/525,742, JPA 6-521927) and proteins of Mycoplasma gallisepticum containing the amino acid sequences of those proteins. Of course, so long as the epitope is contained therein, a part of the peptides described above may also be usable.

15                 Of these peptides, preferred are the polypeptide of about 40 killodaltons (kd) described in JPA 5-824646, the polypeptide of about 66 kd encoded by TM-66 gene and the polypeptide of about 67 kd encoded by TM-67 gene described in JPA 5-521927, which are 20 designated as SEQ NO: 16 and SEQ NO: 27 therein.

               In the present invention, genes of the Mycoplasma-derived polypeptides bear DNA sequences coding for the polypeptide having the antigenicity of Mycoplasma gallisepticum described above. Such DNA can be obtained 25 by synthesis or acquired from wild bacteria belonging to Mycoplasma gallisepticum. Specific examples of such bacteria are strains R, S6, KP-13, PG31, etc. DNA may also be derived from MG isolated from wild strains.

These genes can also be modified by loss, addition, insertion, deletion, substitution, etc. in a conventional manner as described in Methods in Enzymology, etc.

Herpesvirus-derived polypeptides and genes thereof

5 The Herpesvirus-derived polypeptides in the present invention refer to polypeptides derived from proteins that construct an envelope of viruses belonging to the genus Herpesvirus. The Herpesvirus-derived polypeptides may not always be the full length of the 10 proteins. Where the polypeptides are used solely to be expressed on the surface of cell membranes function as fusion proteins, it is sufficient for the polypeptide to contain a membrane anchor and a signal sequence therein, and where the polypeptides are employed for secretion, 15 the polypeptides may contain only a signal sequence for that purpose. The outer membrane proteins may be either type I or type II of the outer membrane proteins. The signal sequence and the membrane anchoring sequence are both readily detectable by analyzing the amino acid 20 sequence in the hydrophobic peptide region at the carboxyl terminus or amino terminus thereof.

Specific examples of the outer membrane protein include gB, gC, gD, gH and gI which are glycoproteins of herpes simplex viruses, and gBh, gCh, gDh, gHh and gIh of 25 MDV corresponding to herpes simplex viruses glycoproteins gB, gC, gD, gH and gI, and proteins of the genus Herpesvirus homologous to the proteins described above.

Of course, polypeptides bearing the epitope other than the signal sequence of the outer membrane proteins may also be ligated with the aforesaid polypeptides having the antigenicity. By the ligation it 5 is expected that the epitope will give the immunity to the living body in vivo.

In the present invention, the genes for the Mycoplasma-derived polypeptides contain DNA sequences coding for the Herpesvirus-derived polypeptides described 10 above and such DNAs can be synthesized or acquired from naturally occurring herpes viruses. These genes may also be modified by loss, addition, insertion, deletion, substitution, etc. in a conventional manner as described in Methods in Enzymology, etc.

15 Fusion protein and hybrid DNA

The fusion proteins of the present invention are obtained by incubating a recombinant Avipox virus inserted hybrid DNA, which will be later described, in culture cells such as chick embryo fibroblast cells 20 (hereinafter referred to as CEF cells) or embryonated chorioallantoic membrane cells, etc.

The thus obtained fusion proteins can be employed as a component vaccine.

The hybrid DNA of the present invention 25 comprises the gene for the Mycoplasma-derived polypeptide and the gene for the Herpesvirus-derived polypeptide, which are ligated with each other directly or via an

optional DNA sequence.

The hybrid DNA of the present invention can be produced in a conventional manner, for example, by a method in which the outer membrane protein and the 5 antigenic protein of Mycoplasma gallisepticum are digested with restriction enzymes, respectively, and the resulting ligatable DNA fragment coding for the outer membrane protein of herpes viruses or for the signal sequence of the outer membrane protein is ligated with 10 the resulting ligatable DNA fragment coding for the antigenic protein of Mycoplasma gallisepticum, using a ligase directly or via an appropriate linker.

Specific examples of the amino acid sequences for the fusion proteins of the present invention include 15 SEQ NO: 2 and SEQ NO: 4. The sequence of the antigenic protein of 40 killodaltons derived from Mycoplasma gallisepticum is found in amino acids 64-456 of SEQ NO: 2 and in amino acids 693-1086 of SEQ NO: 4. The signal sequence of outer membrane protein gB derived from MDV is 20 found in amino acids 1-63 of SEQ NO: 2. In SEQ NO: 4, amino acids 1-672 correspond to almost the full length of outer membrane protein gB derived from MDV. Specific examples of nucleotide sequences of the hybrid DNAs coding for these fusion proteins are those shown by SEQ 25 NO: 1 and SEQ NO: 3.

These fusion proteins and hybrid DNAs are given by way of examples but are not deemed to be limited thereto.

Recombinant Avipox virus

The recombinant Avipox virus of the present invention is a recombinant Avipox virus in which the aforesaid DNA or hybrid DNA has been inserted in the non-5 essential region. The recombinant Avipox virus of the present invention can be constructed in a conventional manner, e.g., by the method described in Japanese Patent Application Laid-Open No. 1-168279. That is, the non-essential region of Avipox virus is incorporated into a 10 DNA fragment to construct a first recombinant vector.

As the non-essential region of Avipox virus which is used in the present invention, there are a TK gene region of quail pox virus, a TK region of turkey pox virus and DNA fragments described in JPA 1-168279, 15 preferably a region which causes homologous recombination with EcoRI fragment of about 7.3 Kb, HindIII fragment of about 5.2 Kb, EcoRI-HindIII fragment of about 5.0 Kb, BamHI fragment of about 4.0 Kb, described in the patent specification supra.

20 Examples of the vector used in the present invention include plasmids such as pBR322, pBR325, pBR327, pBR328, pUC7, pUC8, pUC9, pUC18, pUC19, and the like; phages such as  $\lambda$  phage, M13 phage, etc.; cosmid such as pHC79 and the like.

25 The Avipox virus used in the present invention is not particularly limited so long as it is a virus infected to avian. Specific examples of such a virus include pigeon pox virus, fowl pox virus (hereafter

abbreviated as FPV), canary pox virus, turkey pox virus, preferably pigeon pox virus, FPV and turkey pox virus, more preferably pigeon pox virus and FPV. Specific examples of the most preferred Avipox virus include FPVs 5 such as ATCC VR-251, ATCC VR-249, ATCC VR-250, ATCC VR- 229, ATCC VR-288, Nishigahara strain, Shisui strain, CEVA strain and a viral strain among CEVA strain-derived viruses which forms a large plaque when infected to chick embryo fibroblast, and a virus such as NP strain (chick 10 embryo-attenuated pigeon pox virus Nakano strain), etc. which is akin to FPV and used as a fowlpox live vaccine strain. These strains are commercially available and readily accessible.

Next, the hybrid DNA of the present invention 15 is inserted into the non-essential region of the first recombinant vector described above to construct a second recombinant vector. In general, the hybrid DNA employed may have any nucleotide sequence, irrespective of synthetic or natural one, so long as the hybrid DNA 20 effectively functions as a promoter in the system of transcription possessed by Avipox viruses. Accordingly, not only promoters inherent to Avipox viruses such as promoters for Avipox virus-derived genes coding for thymidine kinase but also DNAs derived from viruses other 25 than Avipox viruses and DNAs derived from eukaryotes or prokaryotes may also be employed in the present invention, insofar as these substances meet the requirements described above. Specific examples of such

promoters include promoters for vaccinia viruses (hereinafter often referred to as VV) as described in *Journal of Virology*, 51, 662-669 (1984), more specifically, a promoter of VV gene coding for 7.5 K 5 polypeptide, a promoter of VV gene coding for 19 K polypeptide, a promoter of VV gene coding for 42 K polypeptide, a promoter of VV gene coding for thymidine kinase, a promoter of VV gene coding for 28 K polypeptide, etc. Furthermore, there may be used a 10 synthetic promoter obtained by modification of the Moss et al. method (*J. Mol. Biol.*, 210, 49-76 and 771-784, 1989), Davidson's synthetic promoter, a promoter obtained by modifying a part of the Davidson's promoter through deletion or change in such a range that the promoter 15 activity is not lost (e.g.,

TTTTTTTTTTGGCATATAAAATAATAATAATAATTACGCGTAAAAA  
TTGAAAAACTATTCTAATTATTGCACTC,  
TTTTTTTTTTTTTTGGCATATAAAATAATAATAATTACGCGT  
AAAAATTGAAAAACTATTCTAATTATTGCACTC etc.).

20 Further in view of easy detection of the recombinant virus, a marker gene such as a DNA coding for  $\beta$ -galactosidase may also be inserted.

The recombinant Avipox virus can be constructed by transfecting the second recombinant vector described 25 above to animal culture cells, which has been previously infected with Avipox virus, and causing homologous recombination between the vector DNA and the viral genome DNA. The animal culture cells used herein can be any

cells, so long as Avipox can grow in the cells. Specific examples of such animal culture cells are CEF cells, embryonated egg chorioallantoic membrane cells, and the like.

5           The objective recombinant Avipox virus is isolated from the virus infected to host cells by plaque hybridization, etc.

Live vaccine

10          The recombinant virus of the present invention constructed by the method described above can be inoculated to avian as a live vaccine for Mycoplasma gallisepticum infection.

15          The live vaccine of the present invention is prepared by, e.g., the following method, though the process is not particularly limited thereto. The recombinant virus of the present invention is infected to cells in which the virus can grow (hereafter referred to as host cells). After the recombinant virus grows, the cells are recovered and homogenated. The homogenate is 20 centrifuged to separate into the precipitates and the high titer supernatant containing the recombinant virus. The resulting supernatant is substantially free of host cells but contains the cell culture medium and the recombinant virus and hence can be used as a live 25 vaccine. The supernatant may be diluted by adding a pharmacologically inert carrier, e.g., physiological saline, etc. The supernatant may be freeze-dried to be provided for use as a live vaccine. A method for

administration of the live vaccine of the present invention to fowl is not particularly limited and examples of the administration include a method for scratching the skin and inoculating the live vaccine on 5 the scratch, effecting the inoculation through injection, oral administration by mixing the live vaccine with feed or drinking water, inhalation by aerosol or spray, etc. In order to use as the live vaccine, the dosage may be the same as ordinary live vaccine; for example, 10 approximately  $10^2$  to  $10^8$  plaque forming unit (hereinafter abbreviated as PFU) is inoculated per chick. Where the inoculation is effected by injection, the recombinant virus of the present invention is generally suspended in about 0.1 ml of an isotonic solvent such as physiological 15 saline and the resulting suspension is provided for use. The live vaccine of the present invention can be lyophilized under ordinary conditions and can be stored at room temperature. It is also possible to freeze the virus suspension at -20 to -70°C and store the frozen 20 suspension.

Particularly where the genes coding for the polypeptides derived from the outer membrane proteins of herpes viruses described above are those coding for polypeptides having more than one epitope of herpes 25 viruses, preferably having at least 90% homology to native outer membrane proteins, the live vaccine of the present invention functions as a vaccine for both Mycoplasma gallisepticum infection and Avipox viral

infection. In addition, the live vaccine of the present invention can also function as an effective vaccine for infection with herpes virus originating from outer membrane proteins. That is, the live vaccine of the 5 present invention can be used as a so-called trivalent vaccine.

#### EXAMPLES

##### Example 1

Construction of recombinant pNZ40K-S bearing hybrid DNA  
10 ligating TTM-1 protein DNA immediately after the signal  
of gB gene for Marek's disease virus (cf. Figs. 1, 2 and  
3)

First, plasmid pUCgB bearing gB gene of Marek's disease virus, disclosed in JPA 6-78764, was digested 15 with restriction enzymes BamHI and SalI to recover a fragment of 3.9 kb.

Separately, plasmid pGTPs was constructed by digesting plasmid pNZ1729R (Yanagida et al., J. Virol., 66, 1402-1408 (1992)) with HindIII and SalI, inserting 20 the resulting DNA fragment of about 140 bp into pUC18 at the HindIII-SalI site thereof, further inserting synthetic DNA (5'-AGCTGCCCCCCCGGCAAGCTTGCA-3') at the HindIII-PstI site, then inserting synthetic DNA (5'-TCGACATTTTATGTGTAC-3') at the SalI-EcoRI site and 25 finally inserting synthetic DNA (5'-AATCGGCCGGGGGGCCAGCT-3') at the SacI-EcoRI site.

The thus obtained pGTPs was digested with

restriction enzymes SalI and BamHI and then ligated with the aforesaid 3.9 kb fragment using a ligase to obtain pGTPsMDgB. Thereafter, pNZ2929XM1 disclosed in WO 94/23019 was digested with EcoRI to recover a fragment of 5 740 bp and then obtained a blunt end with T4 DNA polymerase. On the other hand, pGTPsMDgB was also digested with XbaI and then obtained a blunt end with T4 DNA polymerase. Subsequently, pGTPsMDgB was ligated with the 740 bp fragment having the blunt end using a ligase 10 to construct a new plasmid. This new plasmid was digested with BglII and SalI to recover a fragment of 3.0 kb. The 3.0 kb fragment was ligated with the 1.1 kb fragment obtained through digestion of pNZ2927XM1 with BglII and SalI, using a ligase. Thus, there was obtained 15 a plasmid ligating the N terminus of TTM-1 gene at the C terminus of the signal sequence of gB gene of Marek's disease virus.

Finally, a fragment of 1.4 kb obtained by digestion of pGTPs40K-S with SalI and BamHI was ligated 20 with a fragment of 9.3 kb obtained by digestion of plasmid pNZ1829R with SalII and BamHI, using a ligase. The objective plasmid pNZ40K-S of 10.7 kb was thus constructed for use in recombination.

Example 2

25 Construction of recombinant pNZ40K-C bearing hybrid DNA ligating TTM-1 protein DNA at the C terminus of gB gene for Marek's disease virus (cf. Figs. 4, 5 and 6)

After plasmid pGTPsMDgB obtained in Example 1 was digested with restriction enzyme *Mlu*I, and then obtained a blunt end with *T4* DNA polymerase, which was followed by digestion with restriction enzyme *Xba*I to 5 recover a fragment of 1.9 kb. Separately, pBluescriptII (made by Toyobo Co., Ltd., hereinafter abbreviated as PBSKSII) was digested with restriction enzymes *Xba*I and *Sma*I. The resulting fragment was ligated with the 1.9 kb fragment obtained above using a ligase to give a plasmid.

10 The resulting plasmid was digested with restriction enzymes *Eco*RI and *Sal*I. The resulting fragment was ligated with the 550 bp fragment and the 615 bp fragment, both obtained by digestion of pNZ2929XM1 with restriction enzymes *Eco*RI and *Sal*I and with restriction enzymes

15 *Eco*T22I and *Sal*I, respectively, using a ligase to construct a plasmid. The thus obtained plasmid was digested with restriction enzymes *Xba*I and *Sal*I. The resulting 2.7 kb fragment was ligated with the 3.3 kb fragment obtained by digestion of pGTPsMDgB with

20 restriction enzymes *Xba*I and *Sal*I, using a ligase.

Plasmid pGTPs40K-C ligating the TTM-1 gene at the N terminus thereof with the gB gene for Marek's disease virus at the C terminus thereof was thus obtained.

Finally, a fragment of 2.7 kb obtained by

25 digestion of pGTPs40K-C with *Sal*I and *Xba*I was ligated with a fragment of 9.5 kb obtained by digestion of plasmid pNZ1829R with *Sal*I and *Xba*I, using a ligase. The objective plasmid pNZ40K-C of 12.2 kb for recombination

was thus constructed.

Example 3

Construction of recombinants FPV 40K-C and 40K-S and purification thereof

5           NP strain, which is a fowlpox live vaccine strain, was infected to monolayered CEF at m.o.i. = 0.1. Three hours after, these cells were scraped off from the monolayer by a treatment with trypsin to form a cell suspension. After  $2 \times 10^7$  cells in the suspension were 10 mixed with 10  $\mu\text{g}$  of plasmid pNZ40K-C or pNZ40K-S for use in recombination, the mixture was suspended in Saline G (0.14 M sodium chloride, 0.5 mM potassium chloride, 1.1 mM disodium hydrogenphosphate, 1.5 mM potassium dihydrogenphosphate, 0.5 mM magnesium chloride 15 hexahydrate, 0.011% glucose). The suspension was subjected to electrophoresis under conditions of 3.0 kV  $\text{cm}^{-1}$ , 0.4 msec and 25°C, using Gene Pulser (manufactured by Bio-Rad Co., Ltd.) at room temperature. The plasmid-infected cells were then cultured at 37°C for 72 hours. 20 The cells were lysed by freezing and thawing 3 times to recover viruses containing the recombinant virus.

25           The recovered recombinant virus was selected as follows. The recovered viral solution was infected to monolayered CEF and 10 ml of agar solution containing growth medium was overlaid thereon. After agar was warmed at room temperature, incubation was performed at 37°C until plaques of FPV appeared. Then agar medium

containing Bluo-gal in a concentration of 200 µg/ml was overlaid on the agar followed by incubation at 37°C for further 48 hours. Among all of the plaques, about 1% of the plaques were colored blue. These blue plaques were 5 isolated and recovered. By the same procedures, isolation and recovery were repeated to purify the virus until all the plaques were stained to blue. In general, the repeated procedures were terminated by 3 to 4 days. The purified strains were named 40K-C and 40K-S, 10 respectively. In 40K-C and 40K-S, each position of the DNAs inserted was confirmed by dot blotting hybridization and Southern blotting hybridization.

Example 4

Expression of TTM-1 polypeptide in cells infected with  
15 40K-C and 40K-S

In order to confirm that 40K-C and 40K-S could express TTM-1 polypeptide in infected cells, Western blotting was performed using anti-Mycoplasma gallisepticum S6 strain sera. Virus 40K-C or 40K-S was 20 infected to CEF and cultured at 37°C until plaques were formed. The cells were then scraped off with a cell scraper and centrifuged at 8000G for 20 minutes together with the culture supernatant. The cell-containing precipitates (hereinafter referred to as pellets) were 25 recovered. After washing with PBS, the pellets were centrifuged at 8000G for 20 minutes followed by rinsing to recover the pellets. The pellets were then suspended

in 150  $\mu$ l of PBS. From the suspension 50  $\mu$ l was taken and added with the same volume of Laemmli's buffer (containing 10% mercapto-ethanol). After boiling for 3 minutes, the mixture was subjected to sodium dodecyl sulfate-polyacrylamide gel electrophoresis (hereinafter abbreviated as SDS-PAGE) in accordance with the Laemmli's method (Nature, 227, 668-685 (1970)). The polypeptides isolated on the SDS-PAGE-completed gel were transferred onto a polyvinylidene difluoride membrane (Immobilon 5

10 Transfer Membrane, made by Millipore Inc., hereinafter simply referred to as membrane) according to the method of Burnett et al., (A. Anal. Biochem., 112, 195-203 (1970)) or by the method of Towbin et al. (Proc. Natl. Acad. Sci., 75, 4350-4354 (1979)) by means of 15 electrophoresis. The membrane was dipped for an hour into PBS containing 3% skimmed milk for blocking not to cause any non-specific binding. Next, the membrane was dipped for an hour in PBS in which chick anti-Mycoplasma gallisepticum S6 strain serum was diluted to 1000-fold.

20 Subsequently, the membrane was rinsed with PBS and then dipped for an hour in PBS containing alkaline phosphatase conjugate anti-chick IgG as a secondary antibody. After the membrane was rinsed with PBS, a color-forming reaction was carried out in 10 ml of a 25 solution containing 100 mM Tris hydrochloride (pH 7.5), 0.15 M sodium chloride and 50 mM magnesium chloride, using Nitro Blue Tetrazolium salt (NBT, made by GIBCO-BRL Inc.) and 5-bromo-4-chloro-3-indole phosphate-p-toluidine

(BCIP, made by GIBCO-BRL Inc.) as color-forming substrates.

The results of the Western blotting are shown in Fig. 7.

5 As shown in Fig. 7, proteins could be confirmed with the cells infected both with 40K-S and 40K-C as those reactive at the objective positions. It was thus verified that the expected proteins could be expressed in the recombinant FPV infected cells.

10 Example 5

Antibody-inducing capability of recombinant FPV-inoculated chicken

After 40K-C and 40K-S were cultured in CEF at 37°C for 48 hours, the procedure of freezing and thawing 15 was repeated twice to recover the cell suspension. The cell suspension was adjusted to have a virus titer of 10<sup>6</sup> pfu/ml and then inoculated to SPF chicken (Line M, Nippon Seibutsu Kagaku Kenkyusho) of 7 days old at the right wing web in a dose of 10 µl through a stab needle. After 20 the inoculation, take of the pock was observed and the sera were collected 2 weeks after the inoculation. The antibody titer of the sera collected was determined by ELISA. The purified TTM-1 polypeptide was dissolved in a bicarbonate buffer solution in a concentration of 1 25 µg/well. After adsorption to a 96 well microtiter plate, blocking was effected with skimmed milk to prevent the subsequent non-specific adsorption. Next, a dilution of

the sample serum was charged in each well and then horse radish peroxide-labeled anti-chicken immunoglobulin antibody (rabbit antibody) was added thereto as a secondary antibody. After thoroughly washing, 2,2'-azinodioethylbenzothiazoline sulfonate was added to the mixture as a substrate and a relative dilution magnification of the antibody was measured with an immuno-reader in terms of absorbance at a wavelength of 405 nm. As a primary antibody for control, anti-TTM-1 polypeptide chicken serum was used. The results are shown in Table 1.

Table 1. Antibody titer of rFPV-inoculated chicken by ELISA

Methods for treating chicken	Antibody titer of anti-TTM-1 polypeptide
40K-S inoculation	1024
40K-C inoculation	512
TTM-1 immunization	512
non-inoculated	1

Antibody titer: Dilution magnification when the antibody titer of the group of non-inoculated chicken serum dilution was made 1

As shown in Table 1, the results reveal that when 40K-C or 40K-S was inoculated to chicken, the anti-TTM-1 antibody titer in sera was increased to the level

higher than the antibody titer in sera from the chicken immunized with TTM-1 polypeptide. From the results it was confirmed that the recombinant FPV could significantly induce the antibody titer to the inoculated 5 chicken.

Example 6

Mycoplasma challenge test against recombinant FPV-inoculated chicken

The challenge test was conducted basically in 10 accordance with the standard for biological preparations for animals. The method is briefly described below.

Strains 40K-C and 40K-S were inoculated to SPF chicken (Line M, Japan Biological Science Laboratory) of 5 weeks old at the right wing web in a dose of 10  $\mu$ l 15 through a stab needle. After the inoculation, take of the pock was observed to verify completion of the immunization. Two weeks after the inoculation, Mycoplasma gallisepticum strain R was forced to be intratracheally administered in a dose of  $10^4$  to  $10^5$  20 cfu/chick, whereby infection was made sure. On Day 14 after the infection, the chicken were euthanized with Nembutal. Tissue sections were prepared from the tracheal lesion and scores of the tracheal lesion were determined based on the thickness of tracheal mucous 25 membrane and histological findings. The scores were also determined by the above standard for biological preparations. An average of scores for the tracheal

lesion observed with each chick in the groups was made the score for the respective groups. For information, criteria to determine tracheal lesion scores is shown in Table 2.

Table 2. Standard Criteria for Scoring Tracheal Lesion

Thickness of Mucous Membrane	Histological Finding	Score
90 $\mu\text{m}$ ~	normal appearance of ciliated epithelial cells and mucus gland	0
	In the lamina propria, slight infiltration of round cells or minute nest can be found, but epithelial cell-layer is normal.	1
90 $\mu\text{m}$ ~ 110 $\mu\text{m}$	Epithelial cell are degenerated or disseminated, and the lamina propria is moderately thickened due to round cells infiltration.	2
	Squamous metaplasia of surface epithelium and lamina propria is extremely thickened due to capillary hyperplasia and rounded cells infiltration; cell debris are accumulated in the tracheal lumen.	3

The results of evaluation are shown in Table 3 and Fig. 8.

Table 3. Means tracheal lesion scores in FPV-inoculated Chicken

Vaccination	Lesion Score	
	Average	Standard Error
40K-S	1.38	0.16
40K-C	1.89	0.13
Commercial vaccine	2.11	0.24
TTM-1 polypeptide	1.09	0.23
None	2.27	0.21

As is clearly noted from the results above, the lesion scores of chicken inoculated with 40K-C and 40K-S are obviously low as compared to that of the non-inoculated chicken, indicating that the vaccines of the 5 present invention clearly imparted to chicken the effective infection prevention for Mycoplasma challenge. Thus, the results reveal that 40K-C and 40K-S could be effective vaccines for Mycoplasma gallisepticum.

## INDUSTRIAL APPLICABILITY

According to the present invention, the fusion proteins of the polypeptides derived from antigenic proteins of Mycoplasma gallisepticum and the polypeptides 5 derived from outer membrane proteins of herpes viruses are obtained. The fusion proteins are effective as vaccines for anti-Mycoplasma infection, anti-chicken pox or anti-Marek's disease. By use of the hybrid DNAs coding for the fusion proteins, Mycoplasma gallisepticum 10 antigenic proteins can be efficiently provided on the surface of host cells. Moreover, the hybrid DNAs can secrete the antigenic proteins extracellularly to obtain Avipox viruses that can be efficiently recognized by the antigen recognizing cells in host cells. The thus 15 obtained recombinant Avipox viruses are useful as potent vaccines for anti-Mycoplasma infection.

## CLAIMS

1. A fusion protein comprising a polypeptide having the antigenicity of Mycoplasma gallisepticum and a polypeptide derived from Herpesvirus outer membrane protein, said polypeptide derived from the outer membrane protein being ligated with the polypeptide having the antigenicity of Mycoplasma gallisepticum at the N terminus thereof.

2. A fusion protein according to claim 1, wherein said outer membrane protein is derived from a herpes virus showing infection to fowl.

3. A fusion protein according to claim 2, wherein said outer membrane protein is derived from a Marek's disease virus.

4. A fusion protein according to claim 3, wherein said outer membrane protein is gB protein derived from a Marek's disease virus.

5. A fusion protein according to claim 1, wherein said polypeptide derived from the outer membrane protein is a signal sequence portion in the outer membrane protein derived from a herpes virus.

6. A fusion protein according to claim 5, wherein said outer membrane protein is a signal sequence portion in the outer membrane protein derived from a herpes virus showing infection to fowl.

7. A fusion protein according to claim 5, wherein said signal sequence portion is a signal sequence portion derived from the outer membrane protein of a Marek's

disease virus.

8. A fusion protein according to claim 5, wherein said polypeptide derived from the outer membrane protein is a signal sequence portion of gB protein derived from a 5 Marek's disease virus.

9. A hybrid DNA coding for the fusion protein according to any one of claims 1 through 8.

10. A recombinant vector in which a DNA coding for the fusion protein according to any one of claims 1 10 through 8 has been inserted.

11. A recombinant Avipox virus in which a DNA coding for the fusion protein according to any one of claims 1 through 8 has been inserted.

12. A recombinant live vaccine for anti-fowl 15 Mycoplasma gallisepticum infection comprising as an effective ingredient a recombinant Avipox virus in which a DNA coding for the fusion protein according to any one of claims 1 through 8 has been inserted.

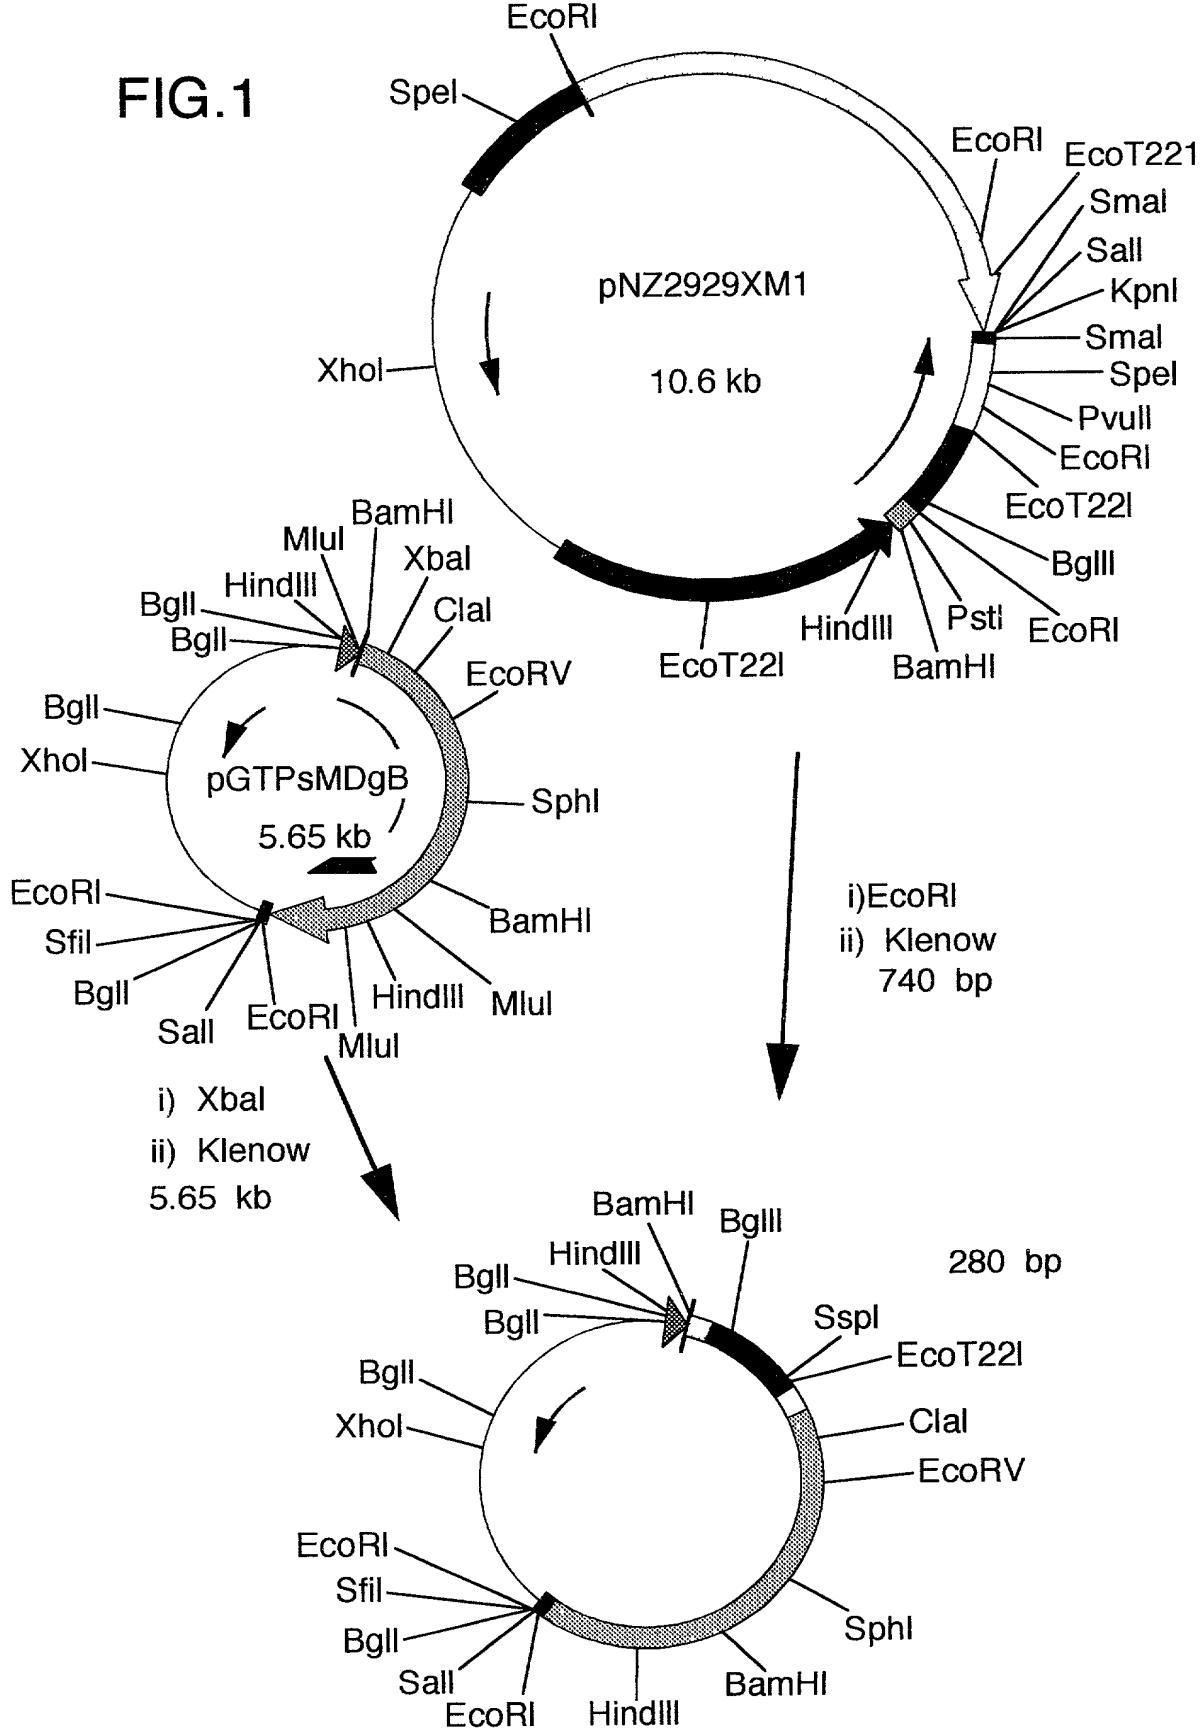

13. A trivalent live vaccine for anti-fowl 20 Mycoplasma gallisepticum infection and anti-Marek's disease infection comprising as an effective ingredient a DNA coding for the fusion protein according to any one of claims 3 and 4.

## ABSTRACT

A DNA coding for a fusion protein comprising a polypeptide having the antigenicity of Mycoplasma gallisepticum and a polypeptide derived from Herpesvirus 5 outer membrane protein, in which the polypeptide derived from the outer membrane protein has been ligated with the polypeptide having the antigenicity of Mycoplasma gallisepticum at the N terminus thereof, is prepared. The DNA is inserted into a region non-essential to growth 10 of Avipox virus and the resulting recombinant Avipox virus is provided as a more potent recombinant virus as an anti-Mycoplasma vaccine.

## **Declaration For U.S. Patent Application**

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention **entitled**  
**(Insert Title) "NOVEL FUSION PROTEIN, GENE THEREOF, RECOMBINANT VECTOR BEARING**  
**THE GENE AND RECOMBINANT VIRUS AS WELL AS USE THEREOF"**

the specification of which is attached hereto unless the following is checked:

was filed on March 28, 1997 as United States Application Number or PCT International Application Number PCT/JP97/01084 and was amended on \_\_\_\_\_ (if applicable).

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claim(s), as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to patentability as defined in Title 37, Code of Federal Regulations, § 1.56.

I hereby claim foreign priority benefits under Title 35, United States Code, § 119 (a) - (d) of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed:

(List prior foreign applications. See note A on back of this page)	08-103548	Japan	29 March, 1996	Priority Claimed
	(Number)	(Country)	(Day/Month/Year Filed)	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
	(Number)	(Country)	(Day/Month/Year Filed)	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
	(Number)	(Country)	(Day/Month/Year Filed)	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
	(Number)	(Country)	(Day/Month/Year Filed)	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No

(See note B on back of this page)

See attached list for additional prior foreign applications

I hereby claim the benefit under Title 35, United States Code, § 119(e) of any United States provisional application(s) listed below.

(Application Number)	(Filing Date)
(Application Number)	(Filing Date)

I hereby claim the benefit under Title 35, United States Code, § 120 of any United States application(s) listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application in the manner provided by the first paragraph of Title 35, United States Code, § 112, I acknowledge the duty to disclose information which is material to patentability as defined in Title 37, Code of Federal Regulations, § 1.56 which became available between the filing date of the prior application and the national or PCT international filing date of the application:

(Application Serial Number)	(Filing Date)	(Status) (patented, pending, abandoned)
(Application Serial Number)	(Filing Date)	(Status) (patented, pending, abandoned)

I hereby appoint the following attorney(s) and/or agent(s) to prosecute this application and to transact all business in the Patent and Trademark Office connected therewith:

James E. Armstrong, III, Reg. No. 18,366; William F. Westerman, Reg. No. 29,988; Ken-Ichi Hattori, Reg. No. 32,861; Le-Nhung McLeland, Reg. No. 31,541; Ronald F. Naughton, Reg. No. 24,616; John R. Pegan, Reg. No. 18,069; William G. Kratz, Jr., Reg. No. 22,631; Albert Tockman, Reg. No. 19,722; Mel R. Quintos, Reg. No. 31,898; Donald W. Hanson, Reg. No. 27,135; Stephen G. Adrian, Reg. No. 32,878; William L. Brooks, Reg. No. 34,129; John F. Carney, Reg. No. 20,276; Edward F. Welsh, Reg. No. 22,455; Patrick D. Muir, Reg. No. 37,403; Gay A. Spahn, Reg. No. 34,978; and John P. Kong, Reg. No. 40,054.

Direct all communications to the following address:

ARMSTRONG, WESTERMAN, HATTORI,  
McLELAND & NAUGHTON  
1725 K Street, N.W., Suite 1000  
Washington, D.C. 20006  
Telephone: (202) 659-2930 Fax: (202) 887-0357

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Title 18 of the United States Code, § 1001 and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.
